

# Lab01-Algorithm Analysis

CS214-Algorithm and Complexity, Xiaofeng Gao, Spring 2021.

\* If there is any problem, please contact TA Haolin Zhou. Also please use English in homework.

\* Name: Zilong Li Student ID: 518070910095 Email: logcreative-lzl@sjtu.edu.cn

1. *Complexity Analysis*. Please analyze the time and space complexity of Alg. 1 and Alg. 2.

Algorithm 1: QuickSort	Algorithm 2: CocktailSort
<b>Input:</b> An array $A[1, \dots, n]$	<b>Input:</b> An array $A[1, \dots, n]$
<b>Output:</b> $A[1, \dots, n]$ sorted nondecreasingly	<b>Output:</b> $A[1, \dots, n]$ sorted nonincreasingly
<pre> 1 <math>pivot \leftarrow A[n]; i \leftarrow 1;</math> 2 <b>for</b> <math>j \leftarrow 1</math> <b>to</b> <math>n - 1</math> <b>do</b> 3   <b>if</b> <math>A[j] &lt; pivot</math> <b>then</b> 4     swap <math>A[i]</math> and <math>A[j];</math> 5     <math>i \leftarrow i + 1;</math> 6 swap <math>A[i]</math> and <math>A[n];</math> 7 <b>if</b> <math>i &gt; 1</math> <b>then</b>    QuickSort(<math>A[1, \dots, i - 1]</math>); 8 <b>if</b> <math>i &lt; n</math> <b>then</b>    QuickSort(<math>A[i + 1, \dots, n]</math>); </pre>	<pre> 1 <math>i \leftarrow 1; j \leftarrow n; sorted \leftarrow false;</math> 2 <b>while not sorted do</b> 3   <math>sorted \leftarrow true;</math> 4   <b>for</b> <math>k \leftarrow i</math> <b>to</b> <math>j - 1</math> <b>do</b> 5     <b>if</b> <math>A[k] &lt; A[k + 1]</math> <b>then</b> 6       swap <math>A[k]</math> and <math>A[k + 1];</math> 7       <math>sorted \leftarrow false;</math> 8   <math>j \leftarrow j - 1;</math> 9   <b>for</b> <math>k \leftarrow j</math> <b>downto</b> <math>i + 1</math> <b>do</b> 10    <b>if</b> <math>A[k - 1] &lt; A[k]</math> <b>then</b> 11      swap <math>A[k - 1]</math> and <math>A[k];</math> 12      <math>sorted \leftarrow false;</math> 13  <math>i \leftarrow i + 1;</math> </pre>

- (a) Fill in the blanks and **explain** your answers. You need to answer when the best case and the worst case happen.

Algorithm	Time Complexity <sup>1</sup>	Space Complexity
QuickSort		
CocktailSort		

<sup>1</sup> The response order can be given in *best*, *average*, and *worst*.

- (b) For Alg. 1, how to modify the algorithm to achieve the same expected performance as the **average** case when the **worst** case happens?
2. *Growth Analysis*. Rank the following functions by order of growth with brief explanations: that is, find an arrangement  $g_1, g_2, \dots, g_{15}$  of the functions  $g_1 = \Omega(g_2), g_2 = \Omega(g_3), \dots, g_{14} = \Omega(g_{15})$ . Partition your list into equivalence classes such that functions  $f(n)$  and  $g(n)$  are in the same class if and only if  $f(n) = \Theta(g(n))$ . Use symbols “=” and “ $\prec$ ” to order these functions appropriately. Here  $\log n$  stands for  $\ln n$ .

1	$n$	$\log n$	$\log(\log n)$	$n \log n$
$\log_4 n$	$2^n$	$4^n$	$2^{\log n}$	$2^{2^n}$
$\log(n!)$	$n!$	$(2n)!$	$n^{1/2}$	$n^2$

**Remark:** You need to include your .pdf and .tex files in your uploaded .rar or .zip file.
